How to Get the Most Accurate & Reliable RapidSTATUS™ Results

*Refer to the direction insert for complete instructions.*

1. PREPARATION

› Always use the pipette included with the kit to ensure the correct volume is used.

› Use anticoagulated whole blood, serum or plasma in all blood tests.

› Bring the test and sample to room temperature before running the test, if necessary.

2. SAMPLE

› Add the sample to the test strip with the pipette vertically without touching the sample window or test strip.
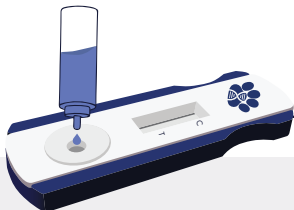

3. ABSORPTION

› Allow the sample to absorb in the sample window. This could take several minutes.

4. BUFFER

› Add buffer to the sample well.

5. WAIT

› Start the timer and wait 10 minutes.

6. INTERPRET RESULTS

| **Postive**	**Negative**	**Invalid**
Both test and control lines are present.	Only the control line is present.	The test is invalid if no line appears at the control line even if a test line is present.
